Protective Video Connector Boot

To further enhance the durability of the **PRO-VISION Video Connector**, our team has designed a protective boot that slides over the connector once the threaded connection has been made. This protective boot is to be utilized on the video cable to video cable connection and the video cable to camera connection. Failure to utilize the protective video connection boot provided will void the camera warranty. Please follow the instructions below for a proper installation:

Step 1

Ensure that the o-ring is present in the female collar end.

Step 2

Line up the external arrows or internal notches and insert the male end into the female end.

Step 3

Thread the female collar to the male end.

Step 4

Thread the female collar to the male end until the threaded collar has bottomed out on the o-ring. Check that the collar has bottomed out by *gently* wiggling both the male and female ends together. *There should be no play between the ends if the female collar is completely threaded down!*

Step 5

Slide the protective boot from either the male end of the video cable or the female end of the camera over the entire connection until both ends are covered.
